

Event Management System

Problem Statement

Scenario

An event planning company, EventZen, is struggling to manage its growing number of events efficiently. They face challenges in:

Manual Event Scheduling: Time-consuming and error-prone process of scheduling events, managing venue bookings, and coordinating with vendors.

Inefficient Attendee Management: Difficulty in tracking attendee registrations, managing guest lists, and sending out event invitations and reminders.

Complex Budget Tracking: Challenges in managing event budgets, tracking expenses, and generating detailed financial reports.

Limited Customer Engagement: Lack of a user-friendly platform for customers to view event details, make bookings, and receive updates.

To address these challenges, EventZen plans to develop a full-stack web application using React, Node, Spring Boot & DotNet. This application will provide a comprehensive solution to streamline operations, improve efficiency, and enhance customer experience.

Instructions for Submission

1. The Application with atleast 2-3 modules (excluding user module for authentication)
2. The Application must contain a User Module with end points for user registration, login with jwt & user management
3. It contains backend (Spring or mixture of spring, nodejs, DotNet (Microservices)) & frontend (React)
4. A Document is to be submitted with
 - Features of the Application with different module details
 - Screenshots of application UI
 - Implemented backend endpoints
 - Frontend Urls & pages
 - Link of the source code on github or gitlab
5. ER Diagram Document
6. Wireframe design Documents
7. UserFlow Documents
8. The application is to be dockerized
9. Any other necessary information

Sample Proposed Solution
